69 **Abstract:**

70 **Background:** Spontaneous preterm birth (SPB) is the most important cause for perinatal morbidity  
71 and mortality. Since women with a twin pregnancy are at increased risk of preterm delivery,  
72 interventions to prevent preterm birth are urgently needed.

73 **Methods:** This is a randomized controlled trial to investigate the effectiveness of cervical pessary in  
74 women with a twin pregnancy and shortened cervix on the short- and long-term neonatal outcome.  
75 The effectiveness of the cervical pessary treatment will be assessed at three different stages of the  
76 second trimester (16-20 (early) vs. 20-24 (middle) vs. 24-28 (late) weeks of gestation).

77 Women eligible for the study will undergo serial cervical length measurements and will be  
78 randomized and allocated to either pessary treatment or expectant management as soon as the  
79 cervical length is shortened below the 25<sup>th</sup> percentile of the reference values. The pessary will be  
80 left in situ until 37 completed weeks or earlier if necessary.

81 Primary outcome is the children`s long-term survival without neurodevelopmental disability at 3  
82 years of corrected age. A key safety endpoint will include the composite neonatal outcome as well  
83 as preterm birth before 34 weeks. Secondary outcomes focus on the short-term outcome of mother  
84 and newborns. We will include 672 women in parallel groups (pessary vs. control group) each using  
85 3 strata according to week of gestation. This will allow us to demonstrate or refute a 18.6% higher  
86 survival rate of children without neurodevelopmental disability at the age of 3 in the pessary-group  
87 (Cochran-Mantel-Haenszel test, alpha-error 5%, 80% power).

88 **Discussion:** We hope to confirm the results of the ProTwinKids-Trial, which demonstrated a 18.6%  
89 higher survival rate of children without neurodevelopmental disability at the age of 3 in the pessary-  
90 group. We postulate that the survival without neurodevelopmental disability depends on the onset of  
91 cervical shortening and its treatment with a cervical pessary, respectively. This project is  
92 summarizing registered RCTs in twin pregnancies all using CORE<sup>3</sup> outcome parameters.

93

94 **Trial Registration:** ClinicalTrials.gov Identifier: NCT03418311. Registered on 23<sup>rd</sup> January 2018.

95 **Keywords:** Preterm Birth, Twin, Cervical length, Arabin Cervical Pessary, Children`s Long-Term  
96 Outcome

## 117 **Background**

### 118 **Background and rational:**

119 Preterm birth (PTB) complicates 13% of all pregnancies worldwide and is the most important cause  
120 of neonatal morbidity and mortality<sup>1</sup>. Women with a twin pregnancy are at increased risk of preterm  
121 delivery. Approximately 50% of women with a multiple pregnancy deliver before 37 weeks of  
122 gestation (WoG), of whom 9% deliver before 32 weeks<sup>2</sup>. The prevalence for multiple pregnancies is  
123 constantly increasing and reached 1.85% in 2015 in Germany<sup>3</sup>.

124 Although disability-free survival rates have increased over the years as a result of improved facilities  
125 and treatments, preterm birth is still accountable for 75% of all perinatal deaths and >50% of  
126 morbidities<sup>4,5</sup>. Morbidity and mortality are inversely related to gestational age; of those infants born  
127 <30 weeks of gestation, only 25% are free of disabilities at the age of five years<sup>5,6</sup> whereas only 8%  
128 of children born at 32 weeks of gestation have a risk for neurodevelopmental delay<sup>7</sup>. However, late  
129 preterm (> 32 WoG) neonates still have a 10-fold increased mortality risk as compared to neonates  
130 born at term<sup>8</sup>.

131 Apart from the personal tragedies for those involved, sPTB generates immense healthcare costs<sup>9</sup>:  
132 The overall health care costs for premature babies differ dramatically by week of gestation at birth:  
133 after their first year of life the total health care costs summed up to 74.000 € for early premature  
134 (<28 WoG), to 8.565 € for late premature (28 WoG – 37 WoG) and to 1.590 € for full-term born  
135 children<sup>10</sup> in Germany. Evidence based treatment guidelines concerning prevention of sPTB are not  
136 available in Europe. Expectant management is still usual care<sup>11</sup> with interventions only in terms of a  
137 tertiary prevention of sPTB according to guidelines for premature rupture of membranes, premature  
138 labour or other pregnancy complications<sup>12</sup>. A short cervix (<25 mm) is associated with early and  
139 very early preterm birth in twins and 15% of women with twin gestations have a cervix  $\leq$  25 mm<sup>13</sup>.  
140 Therapeutic options like vaginal progesterone<sup>14</sup> and cervical cerclage<sup>15</sup> have been shown to be  
141 ineffective in reducing sPTB in twin pregnancies.

142 Cervical pessary treatment is a non-invasive, well-tolerated and cost-effective treatment option<sup>16</sup> for  
143 the prevention of sPTB. The available clinical trials for cervical pessary treatment in twin

144 pregnancies with a shortened cervix reflect contradicting results: the ProTwin<sup>17</sup> and PECEP-Twin  
145 trial<sup>18</sup> (N=267) demonstrated a significant reduction of sPTB. The clinical trial of Nicolaides et al.  
146 <sup>19</sup>(N=214), however, reported no significant effect.  
147 In view of these conflicting results, the Impetus trial is needed to establish evidence based  
148 therapeutic guidelines for the prevention of sPTB in women with a twin pregnancy with a shortened  
149 cervix. The study will assess the effectiveness of pessary placement as soon as the cervical  
150 shortening occurs. The Impetus Trial is a multicentre, open-label, randomised, controlled trial in  
151 parallel groups; it might be considered as part of the prospective meta-analysis conducted by the  
152 Global Obstetrics Network (Go-Net)<sup>20</sup>.

153

154

## 155 **Methods**

### 156 **Study setting**

157 This is a multicenter study to be conducted in 6 hospitals in Germany and in 2 hospitals in Greece.  
158 All hospitals are academic hospitals providing an obstetrical department along with a tertiary  
159 perinatal unit.

160 Participating centres in Greece are: Medical School of the Aristotle-University of Thessaloniki,  
161 University Hospital of Athens and in Germany: Vivantes Klinikum im Friedrichshain Berlin, Charité-  
162 Universitätsmedizin Berlin, Asklepios Kliniken Hamburg, Universitätsklinikum des Saarlandes  
163 Homburg, Universitätsfrauenklinik und Poliklinik am Klinikum Südstadt Rostock, Klinikum  
164 Darmstadt, Klinikum rechts der Isar Technische Universität München. All participating centres will  
165 file their own EC approval.

166 The trial was registered on January 23<sup>rd</sup> in 2018 in ClinicalTrials.gov

167 (<https://clinicaltrials.gov/ct2/results?cond=&term=NCT03418311&cntry=&state=&city=&dist=>); the  
168 trial number is NCT03418311.

169

170

171 **Eligibility criteria:**

172 Women presenting with a diamniotic twin pregnancy in week of gestation (WoG) 16 till 28 and a  
173 shortened cervix below the 25th percentile<sup>21</sup> are eligible for the study. Gestational age will be  
174 determined through menstrual history and first trimesters scan, cervical length (CL) will be  
175 measured by a transvaginal ultrasonography scan (US) according to a standard technique<sup>22</sup>. The  
176 measurements will be performed by experienced and trained maternal-fetal specialists.  
177 Women with monoamniotic pregnancies or pregnancies complicated by suspected twin-to-twin  
178 transfusion syndrome, intrauterine death of one twin, major congenital abnormalities and uterine  
179 malformations will be excluded from the study. Women with active vaginal bleeding, spontaneous  
180 rupture of membranes, painful regular uterine contractions or a cervical cerclage in situ at the time  
181 of randomization will also be excluded. Silicone allergy and a current participation in another RCT  
182 are exclusion criteria as well. Women have to be older than 18 years and capable of giving informed  
183 consent.

184

185 **Maintenance of the randomisation codes and test procedures of the trial.**

186 Every participating centre will have its own randomisation list.  
187 We have created a database in a website so it can be accessed worldwide, that every hospital will  
188 be able to randomize their patients. Every center will receive a password and a username in order  
189 to access the database for recruitment, randomization and documentation of patient data. Hereby, a  
190 personal identification number will be assigned for every patient. Patient names will not appear in  
191 the databases.

192 This database will be supervised and coordinated by Dr. Ioannis Kyvernitakis, Bürgerhospital  
193 Frankfurt/M. (Webmaster).

194

195 **Identification of data to be collected in the case report files (CRF) that should be considered  
196 as data source.**

197 Data will be collected in E-CRF, provided by >Dr. Olaf Hars Wissenschaft, Berlin< on study software  
198 "Castor".

199 **Definition of what is considered to be the end of the study.**

200 The study will be finished after the 3 year-follow up examination concerning neurodevelopmental  
201 disabilities, which will be conducted on the surviving children of the participating patients.

202

203 **Interventions:**

204 Pessary-Group-participants will receive management as usual except for placement of the cervical  
205 pessary (non-invasive) at enrolment including a transvaginal ultrasound to verify its correct fit and  
206 removal of the cervical pessary (non-invasive) in a regular preventive examination at WoG 37. The  
207 Arabin cervical pessary will be used in this trial; it is CE-certified for preventing SPB (CE 0482 / EN  
208 ISO 13485: 2012 + AC: 2012 annex III of the council directive 93/42 EEC)<sup>23</sup>. Serial measurements  
209 of the cervical length should be performed every 4 weeks for all patients until removal of the  
210 pessary.

211 Further surveillance of the pregnancy will not be influenced by the participation in the study.

212 Women in the control group will receive management as usual; i.e. expectant management with  
213 interventions only in terms of a tertiary prevention of PTB according to guidelines for premature  
214 rupture of membranes, premature labour or other pregnancy complications<sup>11</sup>. As therapeutic options  
215 like vaginal progesterone<sup>14</sup> and cervical cerclage<sup>15</sup> have been shown to be ineffective in reducing  
216 sPTB in twin pregnancies no concomitant drug therapy is permitted.

217

218 **Outcomes**

219 The primary outcome will be survival of the children without neurodevelopmental disability at 3 years  
220 of corrected age: neurodevelopmental disability is a common problem regarding preterm new-borns.  
221 As such, the core outcome of the Impetus trial is to assess not only the survival but also the  
222 neurological status of the children as implemented by the CROWN Initiative<sup>24</sup>. This outcome  
223 measure focuses on whether the surviving children will be impaired by a mental disability in life or  
224 not; the exact potential disability is not object of the study. Furthermore, a key safety endpoint will  
225 be preterm birth before 32+0 weeks as well as composite neonatal outcome.

226 Secondary outcomes will be related to the pregnancy, delivery and the short-term outcome of the  
227 neonates. The outcome measures for pregnancy and delivery will be: hospitalisation for threatened  
228 preterm labour (days hospitalisation, tocolytic treatment (type, days, dose); premature rupture of  
229 membranes (PROM); infection / inflammation; physical or psychological intolerance to pessary; rate  
230 of significant maternal adverse events (heavy bleeding, cervical tear due to pessary placement,  
231 uterine rupture); maternal death; preterm birth as rate of delivery before weeks of gestation: 36+6 /  
232 33+6 / 31+6 / 29+6 / 27+6; time to birth; birth weight (g).

233 As short-term neonatal outcome will be assessed: fetal or neonatal death within the first 24 hours;  
234 neonatal morbidity as rate of major adverse neonatal outcomes before discharge from the hospital  
235 (intraventricular haemorrhage III-IV, retinopathy of prematurity, respiratory distress syndrome II-IV,  
236 need for ventilation > 72 h, necrotising enterocolitis, proven or suspected sepsis (antibiotics >5  
237 days), need (days) for neonatal special care, harm from intervention.

238 Our outcome measures meet the core-outcome set for the evaluation of interventions to prevent  
239 PTB published by the crown-initiative in 2016<sup>24</sup>.

240

#### 241 **Participant timelines**

242 Fig 1

243 We expect patient recruitment to take approximately 2 years. The study duration of the entire trial is  
244 estimated to be 68 months, whereas the intervention duration for the clinical trial will take  
245 approximately 29 months and the intervention duration per patient max. 25 weeks.

246

#### 247 **Sample size**

248 For sample size calculation, we account for the stratified design and assume three equally large  
249 gestation groups. For the pessary group, we assume a combined event rate of at least 8% for the  
250 primary outcome and for the comparison of the pessary group with the control group we assume an  
251 odds ratio of 2.29. This odds ratio corresponds to the lower bound of a one-sided confidence  
252 interval for the event rate given in ProTwinKids Trial<sup>25</sup>. To reach a power of at least 80% for a  
253 Cochran-Mantel-Haenszel test for the primary outcome, we have to evaluate at least 500 patients,

254 250 in the pessary group and 250 in the control group. To account for a dropout rate of 25%, overall  
255 n=672 pregnant women will be recruited.

256 The reported response rate of the ProTwinKids<sup>25</sup> study served as a basis for the assumed dropout  
257 rate of 25 % for the primary outcome measure >children`s survival without neurodevelopmental  
258 disability at the age of 3<. For both studies, the follow-up time was 3 years.

259

## 260 **Recruitment**

261 The obstetrics departments of the participating centres will counsel women with a twin pregnancy  
262 and refer them for the regular preventive ultrasound examination from 16 weeks onwards or due to  
263 a suspected cervical incompetence.

264 The obstetrical specialist will confirm that the patient fulfils the inclusion criteria and the study will be  
265 proposed. The patients will be informed about the intended therapeutic effect and possible side  
266 effects. The patient will be given an information sheet and the requisite time to reflect on  
267 participation. In case of participation and after having obtained their informed consent, they will be  
268 randomised in two groups either control group with usual management or pessary group with  
269 immediate placement of the cervical pessary. We expect patient recruitment to take approximately 2  
270 years (Figure 1).

271

## 272 **Randomization and masking**

273 After providing written informed consent all women will be randomly allocated to the cervical  
274 pessary group or the control-group in a 1:1 ratio. The randomization sequence is computer  
275 generated with variable block sizes using a web-based e-CRF (Online-Software Castor<sup>26</sup> is a fully  
276 GCP compliant system) stratified for gestation groups and centers. The allocation code will be  
277 disclosed after the patient`s initials will be confirmed. The investigators or the trial coordinator will  
278 not have access to the randomization sequence. Neonatologists and pediatricians assessing the  
279 children will not be aware of the allocated treatment. The study is open label since masking the  
280 intervention is not possible.

281

282 **Methods: Data collection, management and analysis**

283 **Data collection**

284 The primary outcome measure “children’s survival without neurodevelopmental disability at the age  
285 of 3 years” will be collected by the standardized screening questionnaire Ages & Stages  
286 Questionnaire ASQ-3 (at 36 month of corrected age). The ASQ-3 is a parental questionnaire which  
287 is frequently used for screening developmental delay in problem solving, communication, fine- and  
288 gross motor skills and personal-social behaviour of preschool aged children<sup>27,28</sup>. Additionally the  
289 results of a regular preventive examination at paediatrician for children aged 34-36 month (in  
290 Germany *Vorsorgeuntersuchung U7a* or equivalent examination in Greece) are recorded.

291 All data for the secondary endpoints will be routinely collected during the course of the pregnancy  
292 and birth in the data management system of the caregiving hospital.

293 All investigators will be trained in pessary application. Quality protocols will be submitted according  
294 to the Clara-Angela Foundation requirements for pessary placement.

295

296 **Data management:**

297 Impetus Trial will be conducted according to standard operating procedures (SOP) of the Sponsor.  
298 These SOPs describe the processes during planning, conduct and evaluation as well as the quality  
299 management. It includes a predefined Data Management Plan (DMP), Data Validation Plan (DVP)  
300 and statistical analysis plan (SAP) including a description how to handle missing or implausible  
301 data. Source data verification will be performed in randomly selected centres (5%) as well as in  
302 randomly selected patients (5%) N=35

303 An electronic archiving of all reports and documents will be done for at least 10 years.

304 All data will be collected and processed in standardized electronic case report forms (eCRF)  
305 specially designed for Impetus Trial (=eCRF-Impetus). A feasibility assessment of the eCRF-  
306 Impetus will be done before start of the RCT, regular electronic checks for completeness and  
307 plausibility will be carried out. All AE reporting is done in eCRF. Castor EDC<sup>26</sup> is the Impetus eCRF  
308 software/database which complies with all applicable laws and regulations (Good Clinical Practice,

309 21 CFR Part 11, EU Annex 11; General Data Protection Regulation, HIPAA (US) ISO 9001 and ISO  
310 27001). Castor is a validated system and approved by external auditors.

311 Safety: All SAR/SAE/AE will be reported to Sponsor who will notify *Landesärztekammer Hessen*  
312 *Ethikkommission*, all SAR/SAE (life-threatening or resulting in death) within 24 hours, all not life-  
313 threatening AE within 15 days, all AE will be recorded.

314

### 315 **Statistics**

316 The primary statistical aim is to compare the primary combined outcome “children`s long-term  
317 survival without neurodevelopmental disability at 3 years follow up” with a two-sided Cochran-  
318 Mantel-Haenszel-Test and a significance level of  $\alpha=0.05$  using 3 strata according to week of  
319 gestation. The primary outcome refers to a combined event in any of the twin and will be analyzed  
320 for all pregnancies with available primary endpoint. The stratified study design is accounted by this  
321 stratified test according to the gestation groups. Primary efficacy endpoint will be analyzed for all  
322 pregnancies with available primary endpoint.

323 No imputation method is planned. Nevertheless, to account for attrition bias, group allocations in  
324 this patient cohort with available primary endpoint will base on an intention to treat basis and with a  
325 per protocol allocation as sensitivity analysis.

326 The main statistical evaluation will be performed at two time points. (1) The complete data set for  
327 the secondary endpoints will be available after the last women enrolled in this study has delivered  
328 her twins, so the analysis of these outcome parameter will be done right after this event. (2) The  
329 primary outcome will be evaluated 3 years after the last woman enrolled in this study has delivered  
330 her twins. A descriptive analysis by preterm birth will be carried out calculating means and medians  
331 for quantitative variables and proportions with 95% confidence intervals for categorical variables. In  
332 general, statistical comparisons with the pessary arm and the control arms or other group  
333 comparisons for primary and secondary outcomes will be performed with stratified tests as well as  
334 comparisons in the gestation subgroups. Events will be analyzed for each twin and for single  
335 children assuming appropriate random effect regression models. Further subgroup analyses

336 regarding the cervical length will be performed (e.g. CL 15 to 25mm and below 15mm). All tests will  
337 be two-sided using a significance level of  $\alpha=0.05$ .

338 The secondary outcomes comprise preterm birth rates, need for hospitalization before birth,  
339 maternal adverse events, pessary intolerance vaginal infections and fetal / neonatal death as well  
340 as neonatal morbidity will be analysed with Cochran-Mantel-Haenszel Tests and Chi-Square Tests;  
341 time to birth will be analysed with cox regression. For the secondary outcomes birthweight, days of  
342 hospitalisation (neonates) van Elteren Tests and Wilcoxon-Mann-Whitney Tests will be used.  
343 For the primary endpoint, we expect to have a dropout rate of up to 25% due to the long follow-up  
344 time (3 years) of the study based on *ProTwinKids*<sup>25</sup>; but we do not expect to have lost data for the  
345 secondary endpoints because for these parameters the study has a short follow-up time till time to  
346 birth only.

347

#### 348 **Interim analysis**

349 After birth of 300 twins the key safety parameters • rate of preterm birth  $\leq 32\text{WoG}$  • death before  
350 discharge • rate of SAR/SAE • maternal death will be assessed by a one-sided test with  
351  $\alpha=2,5\%$ . The trial will be terminated as negative if a disadvantage for the pessary-treatment can  
352 be found in one of these tests. To guarantee a high safety level the significance level is chosen  
353 more conservatively than in a Bonferroni correction.

354

#### 355 **Discussion**

356 Cervical pessary treatment is a non-invasive, well-tolerated and cost-effective treatment option<sup>17</sup>  
357 which could be easily implemented in daily practice. But to establish evidence based therapeutic  
358 guidelines on secondary prevention of sPTB concerning the use of cervical pessaries the up to now  
359 existing database is not sufficient. Concerning the short-term children's outcome a significant  
360 positive effect of cervical pessary treatment in twin pregnancies is described in 2 RCT's <sup>17,18</sup>  
361 (N=267) but in the RCT of Nicolaidis et al.<sup>19</sup> (N=214) no significant effect was reported.

362 Up to now only the ProTwinKids Trial<sup>25</sup> (N children: 157 pessary group/ 111 control group)  
363 evaluated the long-term children's outcome concerning cervical pessary treatment for the  
364 prevention of sPTB. In clinical registries, no RCT's were published covering this important aspect;  
365 so the data of the Impetus Trial (N children=1000) are clearly needed. Concerning the pessary  
366 effect on sPTB and maternal outcome the data of more than 650 multiple gestations will help to  
367 establish the role of cervical pessaries and more than 1000 children will clarify the short (>1350  
368 neonates) and long term (min. 1000 children 3 years corrected age) effect of a pessary treatment in  
369 twin pregnancies with a short cervix at three stages of the twin pregnancy (early 16-20 WoG; middle  
370 20-24 WoG and late 24-28 WoG).

371 The results of the Impetus trial are needed to establish evidence based therapeutic guidelines for  
372 the prevention of PTB in twin pregnancies with shortened cervix and investigate the efficacy of  
373 pessary placement as soon as cervical shortening occurs by recruiting patients in three groups (see  
374 above; early, middle and late placement) after serial measurements of cervical length through  
375 transvaginal ultrasound. This RCT is a part of the first worldwide prospective meta-analysis in twin  
376 pregnancies called "the prospective meta-analyses of pessary trials" (PROMPT). This project is in  
377 line with the requirements of the Global Obstetrics Network<sup>20</sup> (GONet) summarizing registered  
378 RCTs in twin pregnancies all using CORE<sup>3</sup> outcome parameters.

379

### 380 **Abbreviations**

381 PTB: Preterm Birth; RCT: Randomized Controlled Trial; WoG: Week of Gestation; CL: Cervical  
382 length; US: ultrasonographic scan; ASQ-3: Ages and Stages Questionnaire-3 (36 month), eCRF:  
383 electronic Case Report Form; EC: Ethics Committee; SAR/SAE: Serious Adverse Reaction/ Serious  
384 Adverse Event, AE: Adverse Event

385

388

389

390 **Ethics approval and consent to participate**

391 The sponsor, participating centers and investigators ensure that this study will be conducted in  
392 accordance with the protocol, the principles of the Declaration of Helsinki, ICH Guidelines for Good  
393 Clinical Practice and in full conformity with relevant regulations as well as applicable national laws  
394 and in accordance with regulations and guidelines applicable to clinical trials relating to medical  
395 devices. The protocol, informed consent form, participant information sheet and any applicable  
396 documents were submitted to the reference Ethics Committee (*Ethik-Kommission der*  
397 *Landesärztekammer Hessen*, Frankfurt/M, Germany) (EC) and written approval has been obtained  
398 (Reference number FF 34/2017). All substantial amendments to the originally approved documents  
399 will also be sent to the respective authorities for approval. All participating centers will file their own  
400 EC approval. Ethic approvals of the participating sites in Greece are not yet available as the  
401 Impetus trial is not yet recruiting. Per study site the study will not begin until the approval of the EC  
402 and their director's consent will be obtained.

403

404 **Consent for publication**

405 Provided.

406

407 **Availability of data and material**

408 All data will be recorded in an eCRF; the database is located on a website so it can be accessed  
409 worldwide by the participating centres. Every centre will receive a password and a username in  
410 order to access the database for recruitment, randomization and documentation of patient data.  
411 Hereby, a personal identification number will be assigned for every patient. Patient names will not  
412 appear in the databases. Every participating centre will have its own randomisation list.

413 All data collected and prepared in the context of the study shall be the property of the Sponsor,  
414 provided that participating center shall remain the owner of its source data.

415

416 **Competing interests**

417 The authors declare that they have no competing interests

418 **Funding**

419 We applied for a governmental fund at *Deutsche Forschungsgesellschaft* (DFG) in August 2017. An  
420 approval for the monetary funding is pending. The DFG is the central self-governing research  
421 funding organisation in Germany, so no competing interests are to be expected.

422

423 **Authors' contributions**

424 IK from Frankfurt/M conceived the study and participated in its design and coordination. EH from  
425 Frankfurt compiled the statistics and power analysis. All authors will participate in the acquisition of  
426 data. All authors read and approved the final manuscript. BWM will coordinate the data monitoring  
427 committee.

428

429 **Acknowledgements**

430 We thank Prof. Dr. Ben Willem Mol (University of Adelaide, Australia), Prof. Dr. Dr. Birgit Arabin  
431 (Philipps-University of Marburg and Clara Angela Foundation, Germany) and Prof. Dr. Zarko  
432 Alfirevic (University of Liverpool, UK) for reviewing the trial protocol. We acknowledge the  
433 contribution of the Clara-Angela Foundation to support international collaboration.

434

435 **Study status**

436 The study is not yet recruiting.

437 **Related articles**

438 No publications have been submitted or published so far.

439 **Dissemination policy**

440 In accord with the participating centres the publication of the results is planned for the impact of  
441 Cervical Pessary Treatment for Prevention of Preterm Birth in Twin Pregnancies with Cervical  
442 Shortening on the prevention of preterm birth and the short-term outcome of the children (secondary  
443 endpoints) and after availability of the data of the children`s long-term survival without  
444 neurodevelopmental disability (primary endpoint) these will be published as well.

445 **Sponsor Information**

446 Bürgerhospital und Clementine Kinderhospital gGmbH, Frankfurt/M, Germany, CEO Wolfgang Heyl,  
447 Nibelungenallee 37-41, 60318 Frankfurt am Main, Germany, Tel: +49 69 1500 0  
448 The initiating study center assumes the role of the sponsor and provides the study coordinator and  
449 principal investigator, no competing interests are to be expected. The sponsor is not associated in  
450 any possible way with the intervention used for this study.
